

## MOLECULAR DIAGNOSTICS

### Molecular Diagnostics

Molecular diagnostics is >\$3 billion market world wide and growing at >20% annually

The aim is to detect:

Viruses

Bacteria

Fungi

Parasites

Proteins

Nucleic acids

In water, plants, soil and organisms

## Diagnostic test

**Sensitivity** the test must be able to **detect very small amounts of target** even in the presence of other molecules.

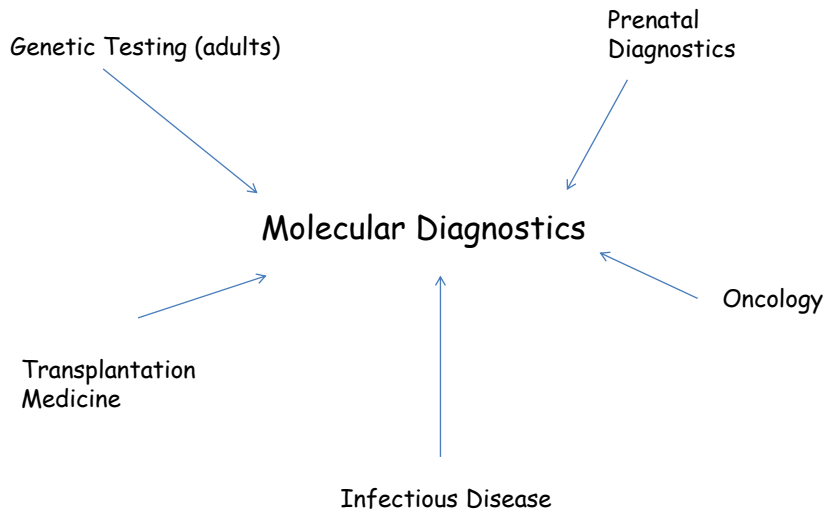

**Specificity** the test yields a **positive result for the target molecule only**.

**Simplicity** the test must be able to **run efficiently and inexpensively** on a routine basis.

## Diagnostic test - the definitions

| Term                            | Definition  | Complications in molecular tests                       | Calculation  |
|---------------------------------|---|--|--|
| Analytical sensitivity          | Refers to the proportion of assays with the genotype that have a positive test result (false-negative rate of the assay)    | Allele drop out; preferential amplification; mosaicism | True positives / (true positives + false negatives)                                  |
| Analytical specificity          | Refers to the proportion of assays without the genotype that have a negative test result (false-positive rate of the assay) |  | True negatives / (true negatives + false positives)                                  |
| Clinical sensitivity            | Refers to the proportion of people with a disease who have a positive test result (false-negative rate of diagnosis)        | Variable penetrance; variable expressivity             | True positives / (true positives + false negatives)                                  |
| Clinical specificity            | Refers to the proportion of people without a disease who have a negative test result (false-positive rate of diagnosis)     |  | True negatives / (true negatives + false positives)                                  |
| Positive predictive value (PPV) | Refers to the likelihood that a patient has the disease given that the test result is positive                              | Depends on health-care system and environment          | True positives / (true positives + false positives)                                  |
| Negative predictive value (NPV) | Refers to the likelihood that a patient does not have the disease given that the test result is negative                    |  | True negatives / (true negatives + false negatives)                                  |
| Clinical utility                | Refers to the value of the test for determining treatment, patient management and family planning                           | Depends on personal vantage                            | Subjectively determined on the basis of reports supporting use and economic benefits |
| Personal utility                | Refers to the value of the test for personal and family choices   |  | Subjectively determined from an individual's perspective                             |

## Fields of interest

## Molecular Diagnostics

### Pre-natal testing

Is the baby healthy?

### Disease predisposition

What diseases is this patient at risk for?

### Disease detection

Does this patient have the disease ?

# Molecular Diagnostics

## Drug selection

What drugs should the doctor prescribe?

## Recurrence monitoring

Does the patient have a recurrent disease?

# Molecular Diagnostics

- Progress is being made in all of these areas
- Each of these areas are commercially attractive

## Genetic Testing: a bit confusing terminology....

**Genetic testing** = DNA-based tests

techniques used to test for genetic disorders which involves direct examination of the DNA

**BUT ALSO**

Other genetic tests include biochemical tests:

for gene products as enzymes and other proteins

for microscopic examination of stained or fluorescent chromosomes.

### Genetic tests in the clinics

| Test                    | Description  | Example   | Embryo or blastocyst (pre-implantation genetic diagnosis)   | Fetus (prenatal testing)  | Child  | Adult                         |
|-------------------------|--|---|---|---|--|-------------------------------|
| Newborn screening       | Targeted tests for recessive genetic disorders   | Phenylketonuria, cystic fibrosis, sickle-cell anaemia       | Not applicable  | Not applicable  | Tests provided at birth vary by country and state or region  | Not applicable                |
| Diagnostic testing      | Confirmatory test or differential diagnosis testing for a symptomatic individual   | Skeletal dysplasias, thalassaemias, craniosynostoses        | Specimen type and limited available amount for sampling may restrict platform selection (for example, WES or WGS versus SNP or STR typing)<br>Turnaround time necessary may restrict platform selection |   | Where treatment is desired, turnaround time may restrict platform selection                              |                               |
| Carrier testing         | Targeted testing for asymptomatic individuals potentially carrying one or more recessive mutation  | Cystic fibrosis, thalassaemias, Tay-Sachs disease           | Applied typically for rare disease but applicable for other familial mutations  |   | Carrier testing of minors is considered in the context of individual paediatric cases <sup>164,165</sup> | According to standard of care |
| Predictive testing      | Tests for variants causing or associated with diseases or disorders with a hereditary component, usually with adult-onset symptoms       | Most cancers, cardiovascular disease, diabetes              | Some have discouraged genetic testing of asymptomatic minors for adult-onset conditions   |   |  | According to standard of care |
| Pre-symptomatic testing | Tests for variants causing or associated with diseases or disorders known to be inherited in the family, often with adult-onset symptoms | Huntington's disease, haemochromatosis, Alzheimer's disease | Some have discouraged genetic testing of asymptomatic minors for adult-onset conditions <sup>162,163</sup><br>Interpretation of VUSs will depend on presenting phenotypes in the family                 |   |  | According to standard of care |
| Pharmacogenetics        | Targeted tests for variants associated with pharmacological dosage choice or adverse reactions   | DNA tests for abacavir, warfarin, carbamazepine             | Application not currently conducted but theoretically feasible  | Application not currently conducted, but conceivably applicable for screening treatment approaches in utero | Pharmacogenetic testing is considered in context of individual paediatric cases <sup>166</sup>           | According to standard of care |

SNP, single-nucleotide polymorphism; STR, short tandem repeat; WES, whole-exome sequencing; WGS, whole-genome sequencing; VUS, variant of unknown significance.

Katsanis et al.; *Nature Genetics*, 2013

## Genetic testing - samples

Blood sample (most common for adult testing);

Mouth washes or buccal scrapes (non-invasive);

Chorionic villus biopsy samples (fetal DNA);

Hair, semen (forensics)

One or two cells removed from 8-cell embryo (in vitro fertilization)

Archived pathological specimens (tumor samples in paraffin blocks);

Paper cards with blood drops

## Genetic testing - methodology

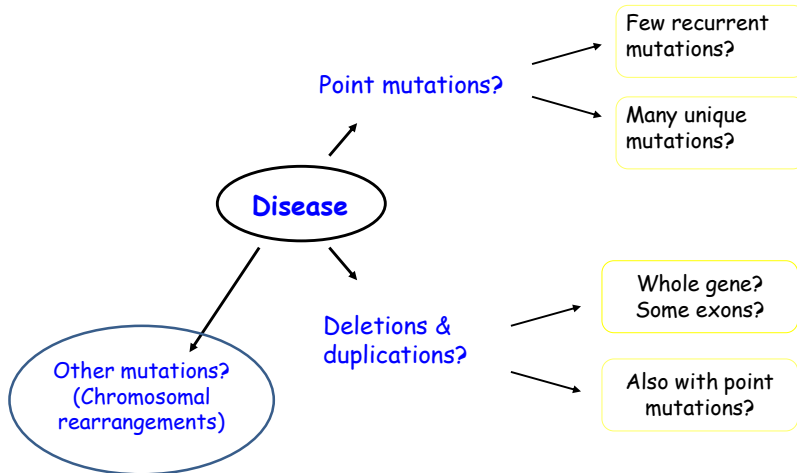

DNA Diagnostic Systems  
include:

- DNA Hybridization
- DNA Sequencing
- PCR
- Restriction endonuclease analysis
- RAPD (random amplified polymorphic DNA)
- DNA fingerprinting

OLD methods !!!!!!!

# Genetic Testing

## Types of Mutations Tested

•High throughput testing for genetic disorders including single nucleotide polymorphisms (SNPs) markers, insertions, deletions

## Hybridization methods - Spectral karyotyping (SKY)

Visualization of all human chromosomes at one time by labeling each pair of chromosomes in a different fluorescent color.

SKY involves the preparation of a large collection of short sequences of ssDNA called probes that hybridize to specific chromosomes

## Spectral karyotyping (SKY)

The limit of resolution is in a range of 5-10 Mb

## SKY - diagnosis of 13q syndrome

Imataka et al. 2012

*13Q* deletion syndrome is a chromosome disorder where one of the arms or the whole arm of the chromosome is missing at birth

Depending on which band of the arm is missing, many symptoms can occur: Global Developmental Delay, Small stature (weight and height), Low Muscle Tone, Seizures, Deafness, Blindness, Reflux, Cleft Palate

## Whole Genome SNP Genotyping

### Omni Whole-Genome Arrays

| BeadChip         | Array Format | Markers per Samp |
|------------------|--------------|------------------|
| HumanOmni5-Quad  | 4            | ~ 4.3 million    |
| HumanOmni2.5S    | 8            | ~ 2.5 million    |
| HumanOmni2.5-8   | 8            | ~ 2.5 million    |
| HumanOmni1S      | 8            | ~ 1.25 million   |
| HumanOmni1-Quad  | 4            | ~ 1.1 million    |
| HumanOmniExpress | 12           | ~ 700,000        |
| HumanCytoSNP-12  | 12           | ~ 300,000        |

### Omni Semi-Custom Whole-Genome Arrays

| BeadChip          | Array Format | Markers per Sample                           |
|-------------------|--------------|--|
| HumanOmni5-Quad+  | 4            | ~ 4.3 million (fixed)<br>up to 500K (custom) |
| HumanOmni2.5S+    | 8            | ~2.5 million (fixed)<br>up to 500K (custom)  |
| HumanOmniExpress+ | 12           | ~700,000 (fixed)<br>up to 200K (custom)      |

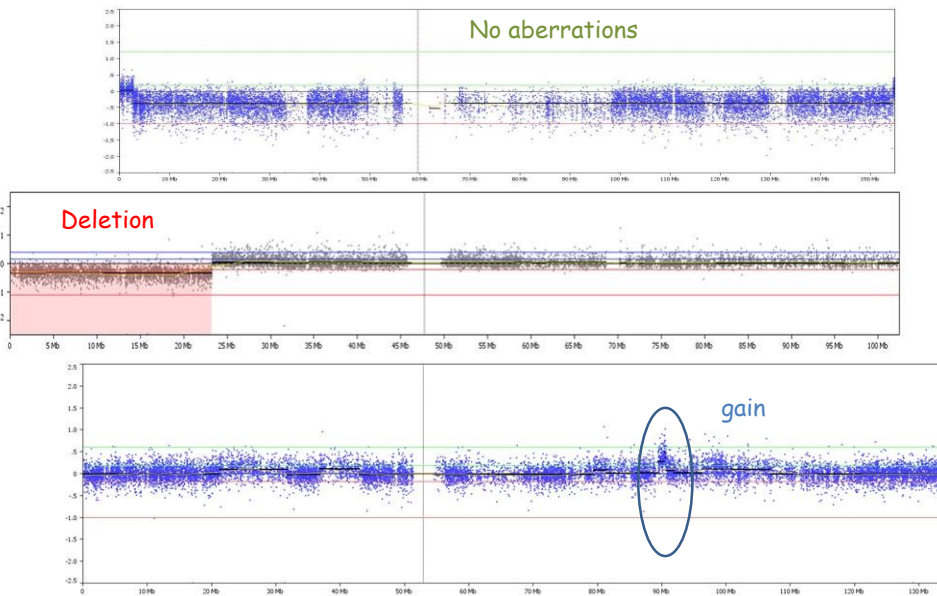

## GWAS - association study

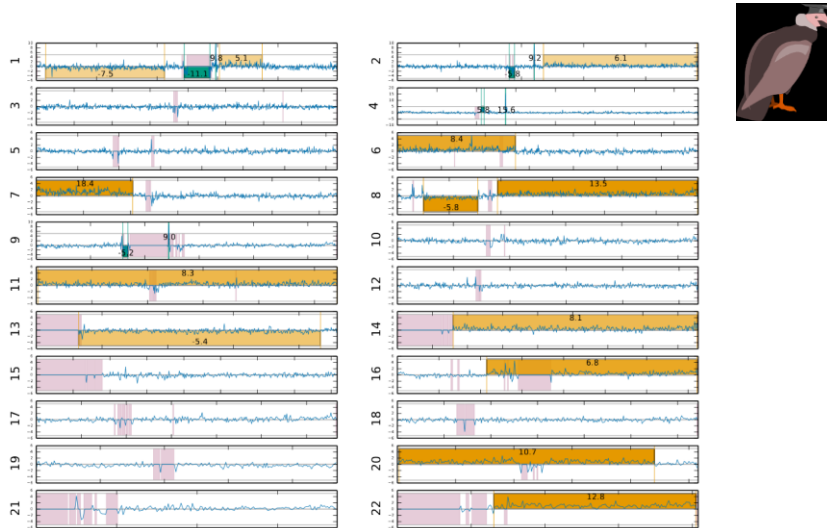

## SNP chips and CNVs

## Analysis of chromosomal aberrations using GWAS

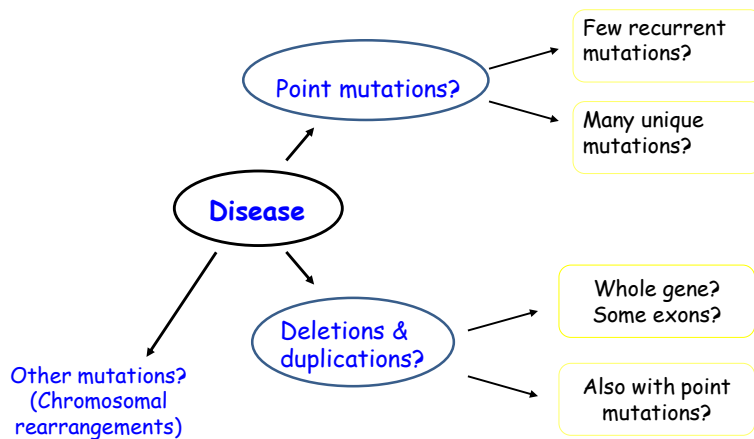

## Analysis of chromosomal aberrations using GWAS

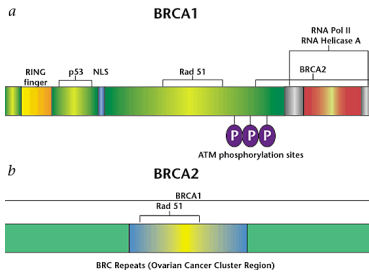

## Genetic Testing

### Types of Mutations Tested

## Molecular diagnostics - single gene tests

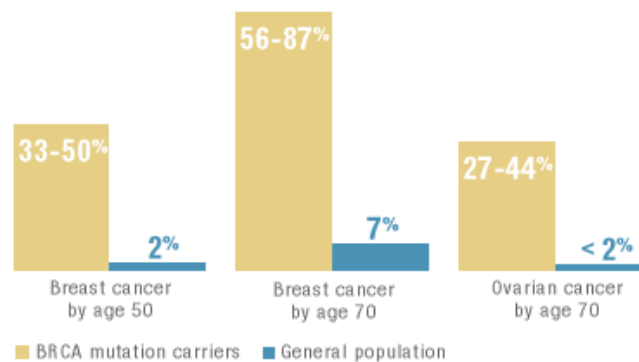

Women who have inherited mutations in these genes face a much higher risk of developing breast cancer and ovarian cancer compared with the general population.

The BRCA gene test isn't routinely performed on women at average risk of breast and ovarian cancers.

Inherited BRCA gene mutations are responsible for about 5 percent of breast cancers and about 10 to 15 percent of ovarian cancers.

## BRCA1&2 mutations

### BRCA Mutation Increases the Risk of Cancer

## Molecular diagnostics - single gene tests

After having a BRCA gene test performed, you learn whether you carry an inherited BRCA gene mutation and receive an **estimate of your personal risk** of breast cancer and ovarian cancer.

How do you perform the test?

## Multiple gene testing

### TruSight One

Targeting > 4,800 genes; enabling labs to expand and streamline their assay portfolio and sequencing portfolio

### TruSight HLA

Accurate, unambiguous, phase-resolved HLA typing in a single assay

### TruSight Myeloid

Uses expert-defined content to identify somatic mutations in myeloid malignancies

### TruSight Cancer

Targeting genes previously linked to a predisposition towards cancer

### TruSight Tumor 15

Focused panel assesses common somatic variants in solid tumors

### TruSight Cardio

Focusing on identifying inherited cardiac conditions

### TruSight Inherited Disease

Focusing on severe, recessive pediatric onset diseases

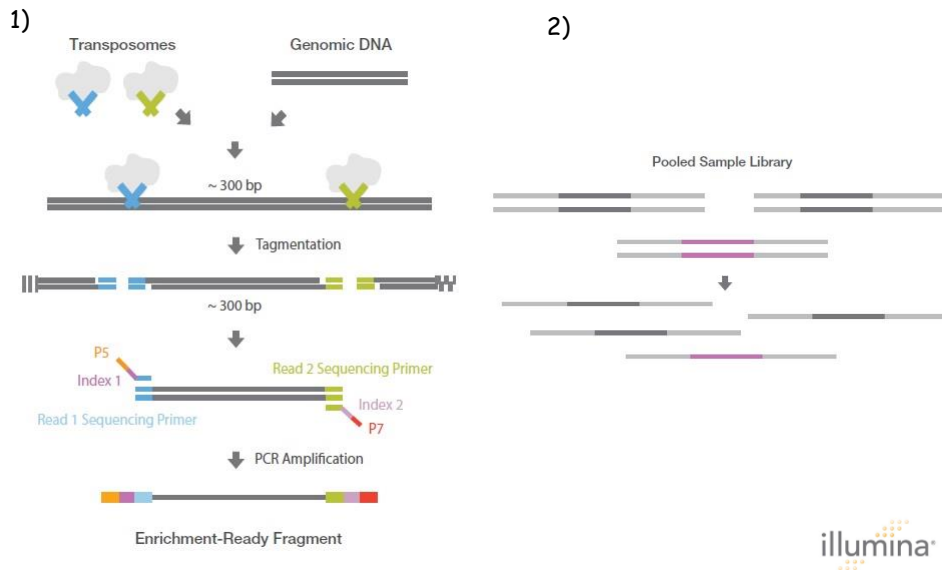

### TruSight Autism

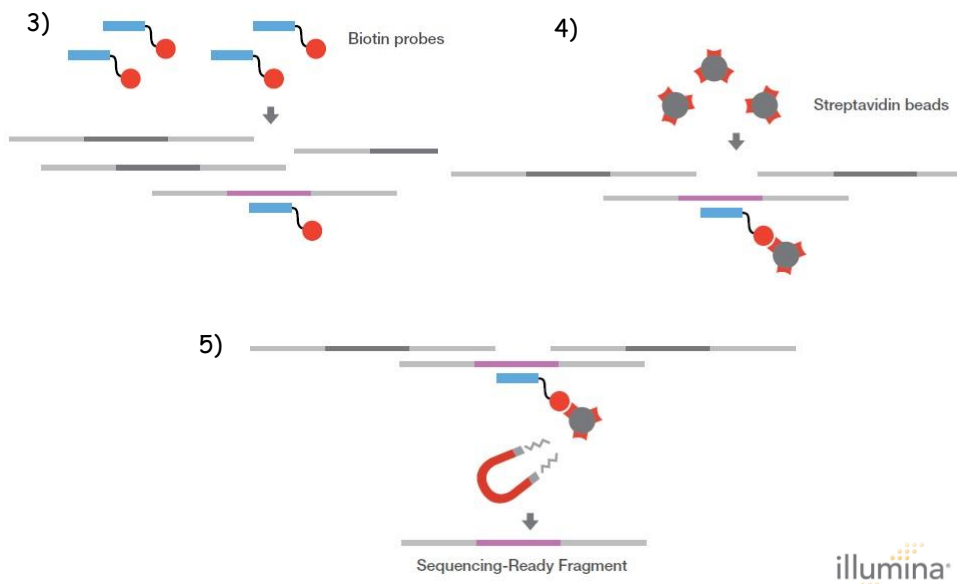

Assisting in the investigation of genomic features associated with autism

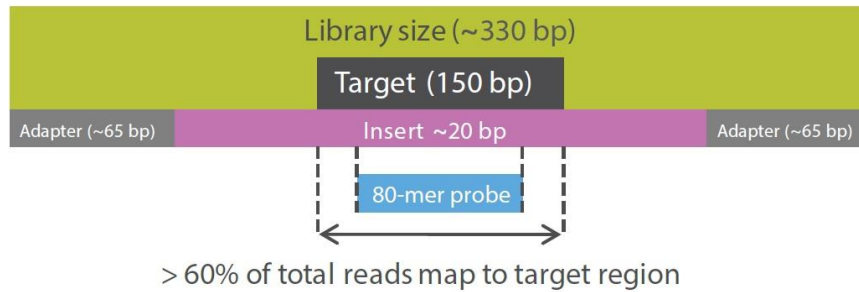

## Multiple gene testing - sequence capture approach

## Multiple gene testing - sequence capture approach

## Multiple gene testing - sequence capture approach

With an approximately 500 bp DNA library (insert size of 300 bp), the probe will enrich 250–650 bp centered around its midpoint.

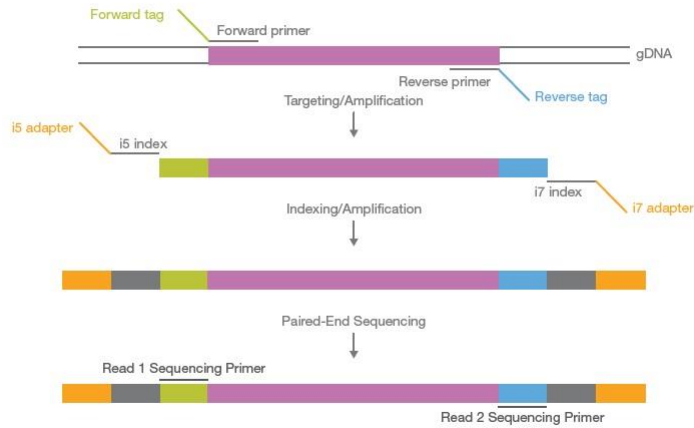

## TruSight Cardio Kit - Inherited Cardiac Conditions

174 genes - 17 ICCs

| Cardiac Condition  | No. of Genes Covered |
|--|----------------------|
| Aortic Valve Disease   | 3                    |
| Marfan Syndrome  | 3                    |
| Loeys-Dietz Syndrome   | 4                    |
| Short QT Syndrome  | 4                    |
| Catecholaminergic Polymorphic Ventricular Tachycardia (CPVT) | 6                    |
| Familial Hypercholesterolemia                                | 7                    |
| Restrictive Cardiomyopathy                                   | 9                    |
| Non-Compaction Cardiomyopathy                                | 10                   |
| Noonan Syndrome  | 11                   |
| Arrhythmogenic Right Ventricular Cardiomyopathy (ARVC)       | 11                   |
| Brugada Syndrome   | 13                   |
| Structural Heart Disease                                     | 15                   |
| Long QT Syndrome   | 15                   |
| Familial Aortic Aneurysm                                     | 16                   |
| Familial Atrial Fibrillation                                 | 21                   |
| Hypertrophic Cardiomyopathy                                  | 47                   |
| Dilated Cardiomyopathy                                       | 59                   |

## Multiple gene testing - amplicon sequencing

### TruSight Tumor 15

134 markers in 34 genes

## Drug transport & metabolism

The cytochrome P450 superfamily (officially abbreviated as CYP) is a large and diverse group of enzymes that catalyze the oxidation of organic substances.

Human CYPs are **primarily membrane-associated** proteins located either in the inner membrane of mitochondria or in the endoplasmic reticulum of cells.

Multi-drug transporters belong to the superfamily of ATP Binding Cassette (ABC) proteins, present in organisms from bacteria to humans, **located in the plasma membrane of the cells or in the membrane of different cellular organelles**, and mediate the translocation of various molecules across these barriers (48 genes, ATP-dependent efflux pumps)

## Drug transport & metabolism

The **solute carrier (SLC)** group of membrane transport proteins include over 300 members organized into 52 families.

Most members of the SLC group are located **in the cell membrane**

NAT1 & 2 arylamine N-acetyltransferases - catalyze the transfer of an acetyl group from acetyl-CoA to various arylamine and hydrazine substrates, take part in drug metabolism

Thiopurine methyltransferase (TPMT) involved in metabolism of the thiopurine drugs such as azathioprine

## Drug transport & metabolism

UDP glucuronosyltransferases (UGT) -  
glucuronidate : bilirubin,  
steroids :testosterone and estrogen;  
serotonin, drugs such as acetaminophen  
and morphine

### Glucuronidation

- UDP-glucuronic acid reacts with alcohol (OH), carboxylic acids (CO<sub>2</sub>H), amines and amides (NH<sub>2</sub>), and thiols (SH)
- For example:

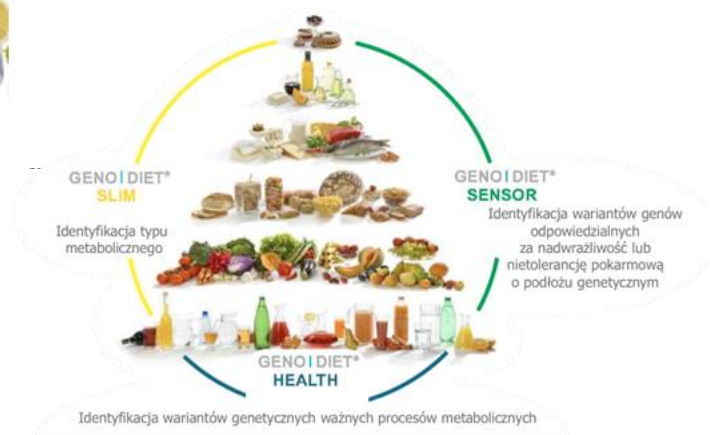

*GSTM1* is a human glutathione *S*-transferase - detoxification of electrophilic compounds, including carcinogens, therapeutic drugs, environmental toxins and products of oxidative stress, by conjugation with glutathione

*VKORC1* - reductase, originally identified as an enzyme activating vitamin K

### Genodieta – test DNA

Współczesna dietetyka

Identyfikuje różne warianty kodu DNA, które wpływają na indywidualną zdolność metabolizmu tłuszczu i węglowodanów. Jest więc największym sprzymierzeńcem w osiągnięciu i utrzymaniu odpowiedniej dla naszego organizmu masy ciała, ale również do zapobiegania chorobom metabolicznym takim jak: cukrzyca, miażdżyca itp.

#### 6 profili dietetycznych:

- A** Metabolizm lipidów jest wyższy niż węglowodanów. Obecność pewnych genów w tym genotypie oznacza, że osoba powinna skupić się na dobrych tłuszczach.
- B** Wskazane jest kontrola spożycia węglowodanów
- C** Utracie masy sprzyja zmniejszenie spożycia węglowodanów. Tłuszcze jednonienasycone mogą być bardzo korzystne.
- D** Tłuszcze nasycone powodują przyrost masy ciała i wzrost poziomu cholesterolu.
- E** Mniejsza wrażliwość na węglowodany, niż na lipidy. Dieta bogata w zbyt dużą ilość lipidów spowoduje wzrost masy ciała i obwodu w pasie.
- F** Mniejsza wrażliwość na tłuszcze, ale bardzo duża na węglowodany.

## Human Glucose Metabolism PCR Array

profiles the expression of 84 key genes involved in the regulation and enzymatic pathways of glucose and glycogen metabolism

### Glucose Metabolism:

**Glycolysis:** ALDOA, ALDOB, ALDOC, BPGM, ENO1, ENO2, ENO3, GALM, GCK, GPI, HK2, HK3, PFKL, PGAM2, PGK1, PGK2, PGM1, PGM2, PGM3, PKLR, TPI1.

**Gluconeogenesis:** FBP1, FBP2, G6PC, G6PC3, PC, PCK1, PCK2.

**Regulation:** PDK1, PDK2, PDK3, PDK4, PDP2, PDPR.

**TCA Cycle:** ACLY, ACO1, ACO2, CS, DLAT, DLD, DLST, FH, IDH1, IDH2, IDH3A, IDH3B, IDH3G, MDH1, MDH1B, MDH2, OGDH, PC, PCK1, PCK2, PDHA1, PDHB, SDHA, SDHB, SDHC, SDHD, SUCLA2, SUCLG1, SUCLG2.

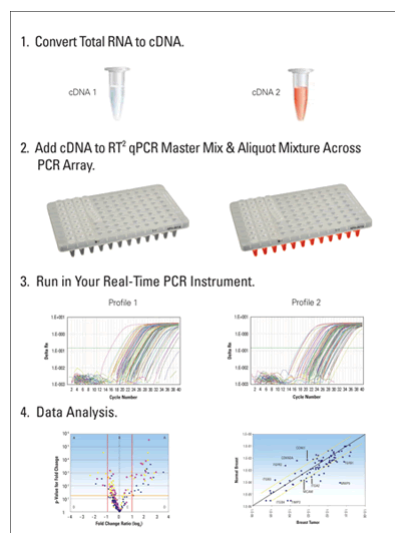

**Pentose Phosphate Pathway:** G6PD, H6PD, PGLS, PRPS1, PRPS1L1, PRPS2, RBKS, RPE, RPIA, TALDO1, TKT.

### Glycogen Metabolism:

**Synthesis:** GBE1, GYS1, GYS2, UGP2.

**Degradation:** AGL, PGM1, PGM2, PYGL, PYGM.

**Regulation:** GSK3A, GSK3B, PHKA1, PHKB, PHKG1, PHKG2.

The Science of Beauty

SkinDNA uncovers your skins potential:

- 1 Firmness + Elasticity**  
Are you genetically predisposed to premature wrinkling?
- 2 Wrinkling (A.G.E.)**  
Supporting skin damage through a process called glycation
- 3 Sun Damage + Pigmentation**  
How well are you intrinsically protected from the sun?
- 4 Free Radclal Damage**  
Are you genetically protected against free radical vulnerability?
- 5 Sensitivity + Inflammation**  
How well are your genes protecting you against irritation?

SkinDNA™ is a revolutionary DNA laboratory test that examines 16 genetic markers (SNPs) in 5 categories associated with skin aging.

- 1 Firmness + Elasticity**
- 2 Wrinkling (A.G.E.)**
- 3 Sun Damage + Pigmentation**
- 4 Free Radical Damage**
- 5 Sensitivity + Inflammation**

Your DNA results are used to scientifically create a personalised guide provide you with a unique regime tailored specifically to you. This allows you to advance beyond the 'one-size-fits-all' suggestions - using the right skincare ingredients targeted to your own genetic blueprint.

We know that not every skincare product is going to suit everyone no matter how much the cosmetic industry tells you. And this is why there are SO many brands out there and literally thousands of different products.

Let SkinDNA™ take the guesswork out of skin care, instead using science to identify the most suitable skincare ingredients - based on your DNA.

# Should we believe this?

**1 in 3 people** have a genetic variation that predisposes their skin to accelerated collagen breakdown.

The SkinDNA™ Genetic Test can help identify if you are a carrier of key genetic variations associated with accelerated collagen loss - even before the signs have become visible.

Keeping the skin firm, plump and wrinkle-free, Collagen is the principle structural protein of the skin. Like many components of the body, collagen undergoes continuous turnover, being produced and recycled on an ongoing basis throughout your life. When you are younger, your body makes more collagen than it loses, but after about the age of 40, collagen loss can accelerate, leading to a decline in the health and appearance of your skin.

Our genetic predispositions play a big role in determining both the speed of collagen production and breakdown. Key variations in this genetic category can identify if the rise and fall of collagen is in balance, or if the breakdown of collagen predominates, which can result in the appearance of premature wrinkling, aging and sagging of the skin. ▶

Genetic Markers SkinDNA™  
Test for in this category.

## Gene Table

| SkinDNA™ Gene Descriptor               | Genotype | Description  |
|--|----------|--|
| s700298/<br><b>Collagen Breakdown</b>  | 1G1G     | Involved in slowing the breakdown and degradation of Collagen fibers found in the extracellular matrix of human tissue.<br>Chromosome Location: 11q21-q22  |
| s706371/<br><b>Collagen Protection</b> | TT       | Assists in protecting existing collagen from unnecessary degradation and aids in normalising skin cell functions disrupted by oxidative stress including MMP-1 production<br>Chromosome Location: 3q21.3 |

## Multiple gene testing- targeted assays

Amplicon sequencing  
Sequence capture

Small sequencers

illumina

MiSeq

~35GB

life  
technologies

Ion Proton

## Multiple gene testing- targeted assays

Amplicon sequencing  
Sequence capture

MiniSeq

~16GB

## Whole genome exome sequencing (WES)

- challenging regions of the genome with current sequencing platforms:

no high GC content fragments, large repeat regions, centromeres, telomeres

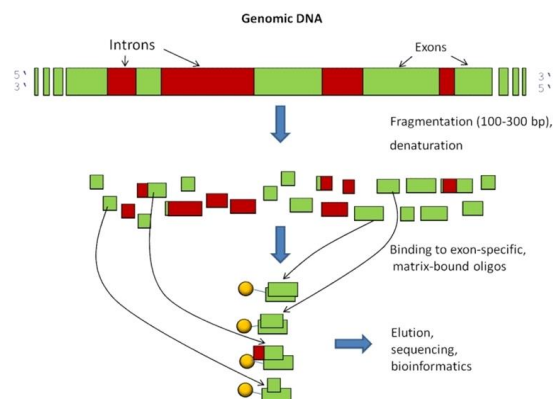

- focuses on just the protein coding sequences 1 - 2% of the genome

- WES samples are typically sequenced to a higher depth (100X vs 30X)

- The amount of sequence needed for a 100X exome sample is ~5-6Gb, substantially less than the ~90Gb needed for WGS

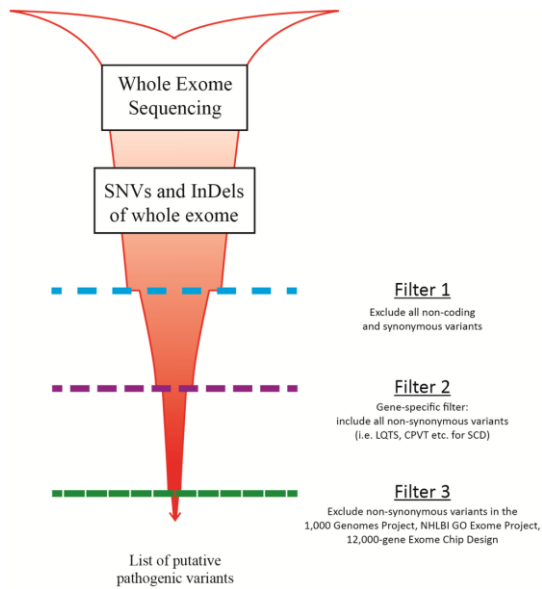

## Whole exome sequencing -the principle

## Whole exome sequencing -the principle

## WES - the data

## Disadvantages of WES

- The enrichment steps involved in WES lead to non-uniform coverage:

'hot spots' with too much coverage (a waste of sequencing power)

regions with too little coverage (leading to missed variant calls)

a region dense with SNPs can interfere with the capture process,  
as the enrichment baits may not hybridize as efficient

- Maximally 2x100bp reads

the longer reads available for whole genome sequencing allows for better determination of copy number variations, rearrangements and other structural variations

## Who should consider WES??

- Individuals who have had extensive genetic testing but a diagnosis has not yet been identified
- Individuals who very likely have a genetic condition but the diagnosis is unclear
- Individuals who have a genetic condition that could be caused by many different genes
- Individuals with an undiagnosed disorder who want to be as aggressive about determining if the cause is genetic

## Genetic Testing - Pre-natal Diagnostics

130 million live births worldwide per year

8 million live births in US and Europe per year

6% of all babies are born with birth defects over 900 fetal genetic disorders

only non-invasive method: Ultrasound

No accurate, non-invasive prenatal diagnostic tests ("NIPD") available

## Genetic Testing - Pre-natal Diagnostics

Down syndrome is the most common chromosomal abnormality

= trisomy 21

Although risk increases with age, 80% of Down births are in women <35 years old

Sensitivity????

Even though limited to high risk mothers, still a \$600 million market in US and \$1.5 billion market worldwide

Other diseases : Cystic fibrosis?

## Genetic Testing - Pre-natal Diagnostics

at the moment invasive methods available -> require a certain amount of fetal cells

Amniotic stem cells are collected from **amniotic fluid** extracted during a genetic **amniocentesis**, a prenatal diagnosis procedure typically performed during the 2nd trimester of pregnancy.

cells are heterogeneous cell population of exfoliated fetal and amniotic cells

## Genetic Testing - Pre-natal Diagnostics

a risk of miscarriage or infection that is estimated at about 1 in 400

In vitro steps - chromosomal instability

w/o cell culture - small DNA amounts

## Genetic Testing - Pre-natal Diagnostics

fetal blood cells gain the access to maternal circulation through the placental villi.

Ordinarily, only a very small number of fetal cells enter the maternal circulation in this fashion

it is difficult to get many fetal blood cells.

There may not be enough to reliably determine anomalies of the fetal karyotype or assay for other abnormalities

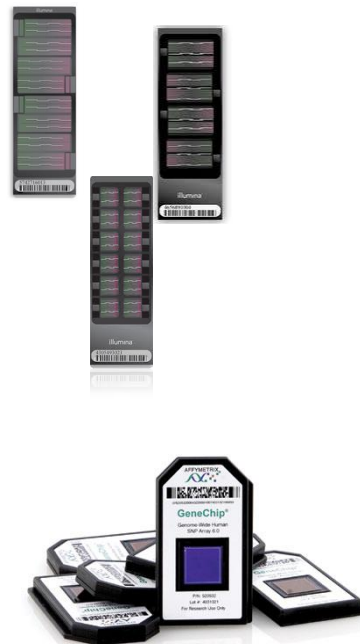

## Whole Genome SNP Genotyping

### Omni Whole-Genome Arrays

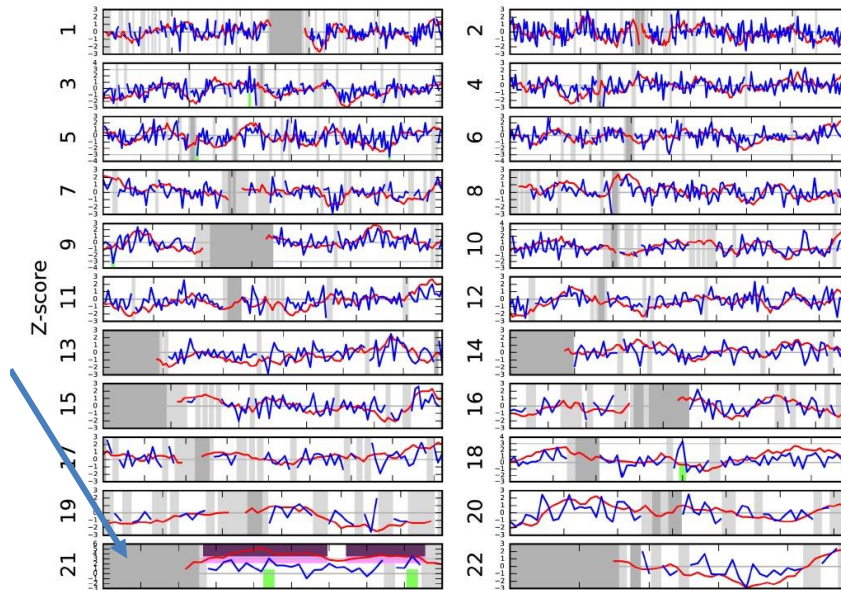

| BeadChip         | Array Format | Markers per Samp |
|------------------|--------------|------------------|
| HumanOmni5-Quad  | 4            | ~ 4.3 million    |
| HumanOmni2.5S    | 8            | ~ 2.5 million    |
| HumanOmni2.5-8   | 8            | ~ 2.5 million    |
| HumanOmni1S      | 8            | ~ 1.25 million   |
| HumanOmni1-Quad  | 4            | ~ 1.1 million    |
| HumanOmniExpress | 12           | ~ 700,000        |
| HumanCytoSNP-12  | 12           | ~ 300,000        |

### Omni Semi-Custom Whole-Genome Arrays

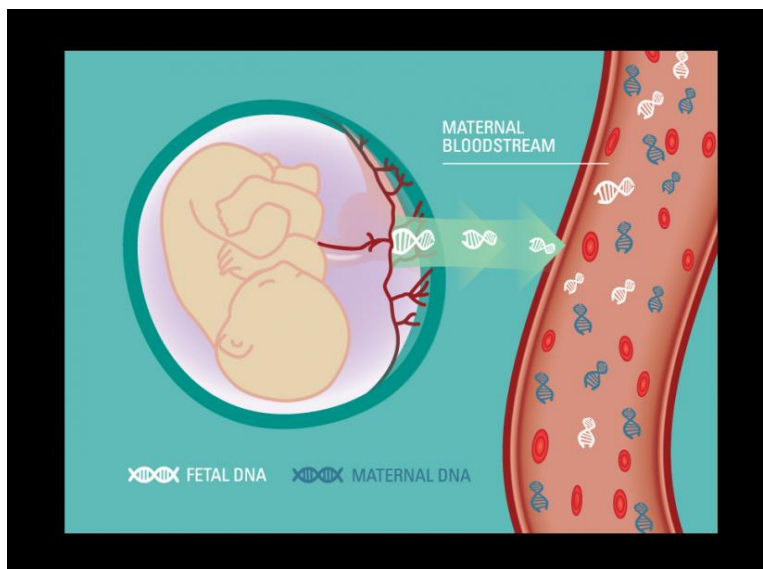

| BeadChip          | Array Format | Markers per Sample                           |
|-------------------|--------------|--|
| HumanOmni5-Quad+  | 4            | ~ 4.3 million (fixed)<br>up to 500K (custom) |
| HumanOmni2.5S+    | 8            | ~2.5 million (fixed)<br>up to 500K (custom)  |
| HumanOmniExpress+ | 12           | ~700,000 (fixed)<br>up to 200K (custom)      |

## Analysis of chromosomal aberrations using GWAS Pre-natal Diagnostics

## Genetic Testing - Pre-natal Diagnostics- NIPT

Free fetal DNA

## Genetic Testing - Pre-natal Diagnostics

1-5% of isolated DNA

~ 5-10 mln aligned reads

### NIPT using cell-free DNA in maternal blood

- since 2014: **TRIDENT** study in the Netherlands
  - Trisomy 21
  - Trisomy 18
  - Trisomy 13

Patients with increased risk after first trimester combination test may choose between NIPT and invasive array testing.

ONLY LARGE CHROMOSOMAL  
REARRANGEMENTS

## MeDiP -methylated DNA immunoprecipitation

Assay based on free fetal DNA (ffDNA) in the maternal circulation during pregnancy (maternal plasma)

fetal-specific methylated regions located on chromosome 21

antibody specific for 5-methylcytosine to capture methylated sites and therefore enrich for fetal-specific methylated DNA

Papageorgiou et al., Nature Medicine, 2012

## Genetic Testing - Pre-natal Diagnostics

Hui et al., 2013

## Diagnostics - novel approaches

## Cell free DNA (cfDNA)

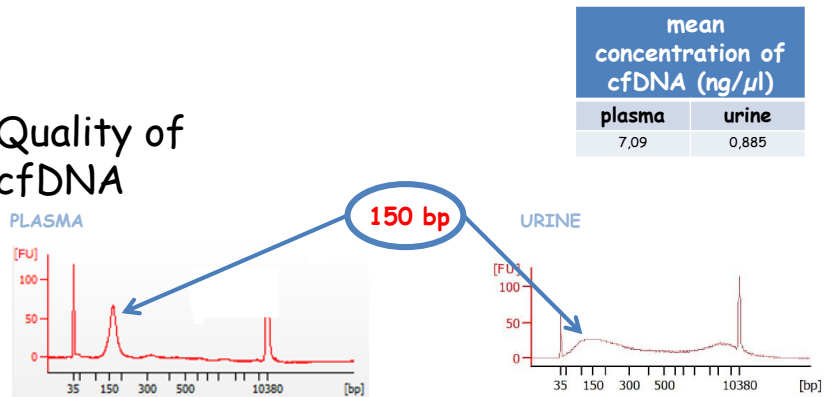

- Discovered in 1948 in blood by Mendel and Metais
- Recent studies revealed that concentrations of cfDNA is very low in healthy individuals
- And is higher in cancer patients and patients with autoimmune diseases
- In healthy individuals cfDNA are longer than 200 bp.
- The length of „true“ cell free DNAs is shorter than 150 bp in cancer

# cfDNA concentration in plasma and urine of ccRCC patients

## Quality of cfDNA

## Shallow NGS Sequencing

Libraries sequenced using HiScanSQ

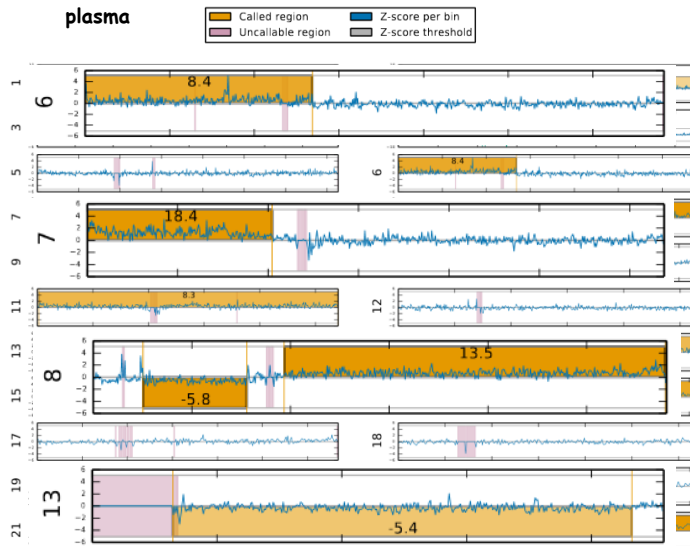

SR50

| Mean Reads Identify PF | Mean Aligned Reads |
|------------------------|--------------------|

## Real-Time PCR in molecular diagnostics

Applied Biosystems

illumina

## Panbacterial qPCR

Amplification and sequencing of the gene encoding 16S ribosomal RNA using universal primers

rapid and wide-spectrum detection of bacteria

all clinical samples can be tested

detection of bacteria responsible for :  
 Meningitis  
 Endocarditis  
 Arthritis  
 osteitis  
 deep abscesses and suppurations

## qPCR for Easy-to-Grow Bacteria

### *Staphylococcus Aureus*,

a wide range of infections in humans including skin and soft tissue infections, arthritis, osteitis, deep abscesses, pneumonia, endocarditis, urinary tract infections, enteritis and bacteremia

methicillin-resistant *S. aureus* (MRSA) is a major nosocomial pathogen

**Application: clinical samples and blood cultures**

*Haemophilus Influenzae*, primarily involved in upper and lower respiratory tract infections, serotype b (Hib) predominate and are the more severe. Some qPCR tests also allow determination of the particular bacterial strains

**Application: cerebrospinal fluid and sputum samples**

## qPCR for Slow-Growing, Fastidious-Growing & Uncultivable Bacteria

### *Chlamydia Trachomatis* & *Neisseria Gonorrhoeae*

two main etiological agents of sexually transmitted infections (STIs).

Both organisms may cause obstetrical complications and infection in the neonate.

#### Application: urogenital samples

2.8 mln new cases per year in the US

## qPCR for Slow-Growing, Fastidious-Growing & Uncultivable Bacteria

*Borrelia burgdorferi*, *Borrelia afzelii* and *Borrelia garinii* are responsible for most cases of Lyme disease.

These spirochetes are transmitted to humans via tick bites.

The disease should be diagnosed during the acute phase (a influenza-like illness ) to prevent evolution to complications, including articular, neurological and cardiac involvement.

#### Application: synovial fluid or synovial membrane biopsies of affected joints

## Multiplex qPCR for Diagnosis of Syndromes & Other Specific Clinical Situations

### Bacteremia

#### multiplex qPCR tests

Bacteremia is an urgent situation that needs rapid detection and identification of the involved bacterial species in order to optimize antibiotic therapy and improve patient's prognosis

*E. coli*, *S. aureus* and *S. pneumoniae*.

rapid identification and evaluation of specific antibiotic resistances in bacteria grown in blood cultures

### Bio-threat Agents.

early characterization of the involved pathogen and implementation of adapted therapeutic and prophylactic measures

*B. anthracis*, *Y. pestis*, *F. tularensis*, *B. melitensis*, *Rickettsia* sp., *C. burnetii*

## qPCR for Detection of Antibiotic Resistance Gene Determinants

In patients suffering from bacterial infections, quick determination of the antibiotic susceptibilities of the involved strain is of primary importance for rapid adaptation of the antibiotic therapy

The most widely-used commercial qPCR tests are those allowing detection of the *mecA* gene responsible for resistance to methicillin in *S. aureus*,

Also for *vanA* and *vanB* genes responsible for resistance to glycopeptides in *Enterococcus* species

Copyright Dennis Kunkel

## Quantification of Bacterial Load Using qPCR

these tests quantify DNA from both viable and nonviable bacteria, results may be higher than those obtained by quantitative culture.

A high correlation between both methods was reported for *S. pneumoniae*, that causes many types of pneumococcal infections also other than pneumonia

In-house qPCR tests have been used for quantification of the bacterial load in clinical samples to differentiate infection from commensalism and to determine disease severity and patients' prognosis

Thank you for your attention
